# CS2102 Database Systems

#### **Last Lecture**

 $A \rightarrow B, B \rightarrow C$ 

- Functional dependencies (FD)
  - Example above:  $A \rightarrow B$ ,  $B \rightarrow C$
- Superkeys of a table R
  - A set of attribute that can decide all other attributes in R
  - Example above: A, AB, AC, ABC are all superkeys of R
- Keys
  - A superkey that is minimal
  - Example above: A is the only key of R
- Finding superkeys/keys from R
  - Using closures, based on the given FDs

## **Coming Next**

Normal forms

## **Coming Next**

#### **Normal Forms**

- Conditions that a "good" table should satisfy
- Various normal forms (in increasing order of strictness)
  - 1st NF
     2nd NF
     Easy to satisfy
     May have high redundancy
- NOT GOOD ENOUGH COMPANS AND THE STATE OF THE

- 3rd NF (3NF)
- Boyce-Codd NF (BCNF)
- 4th NF
   5th NF
   6th NF

  Very little redundancy
  Not always possible to satisfy

#### **Normal Forms**

- Conditions that a "good" table should satisfy
- Various normal forms (in increasing order of strictness)
  - 1st NF
  - 2nd NF
  - □ 3rd NF (3NF)
  - Boyce-Codd NF (BCNF)
  - 4th NF
  - 5th NF
  - 6th NF

Get rid of most redundancies Always possible to satisfy

## Roadmap

- We will focus on 3NF and BCNF since they are the most commonly used NF
- We will start from BCNF since it is conceptually simpler

- To simplify our discussions of BCNF and 3NF, we will focus on non-trivial and decomposed FDs
- Decomposed FD: an FD whose right hand side has only one attribute
  - $\square$  E.g.,  $A \rightarrow C$ ,  $BC \rightarrow D$ ,  $DEF \rightarrow E$
- Note: a non-decomposed FD can always be transformed into an equivalent set of decomposed FDs
  - E.g., BC $\rightarrow$ DE <==> BC $\rightarrow$ D and BC $\rightarrow$ E

- To simplify our discussions of BCNF and 3NF, we will focus on non-trivial and decomposed FDs
- Non-trivial and decomposed FD: a decomposed FD whose right hand side does not appear in the left hand side
  - $\square$  E.g.,  $A \rightarrow C$ ,  $BC \rightarrow D$
- We will check normal forms based on the nontrivial and decomposed FDs on a table
- How do we derive such FDs?

- Non-trivial and decomposed FDs can be found using closures, in a way similar to finding keys
- Example: R(A, B, C), with A $\rightarrow$ B, B $\rightarrow$ A, B $\rightarrow$ C given
- Step 1: Consider all attribute subsets in R
  - □ {A}

{B}

{C}

■ {AB}

{AC}

{BC}

- Non-trivial and decomposed FDs can be found using closures, in a way similar to finding keys
- Example: R(A, B, C), with A $\rightarrow$ B, B $\rightarrow$ A, B $\rightarrow$ C given
- Step 2: Compute the closure of each subset
  - □ {A}

{B}

{C}

□ {AB}

{AC}

{BC}

- Non-trivial and decomposed FDs can be found using closures, in a way similar to finding keys
- Example: R(A, B, C), with A $\rightarrow$ B, B $\rightarrow$ A, B $\rightarrow$ C given
- Step 2: Compute the closure of each subset

$${B}^{+} =$$

$$\{C\}^+ =$$

$$\{AC\}^+ =$$

$$\{BC\}^+ =$$

- Non-trivial and decomposed FDs can be found using closures, in a way similar to finding keys
- Example: R(A, B, C), with A $\rightarrow$ B, B $\rightarrow$ A, B $\rightarrow$ C given
- Step 2: Compute the closure of each subset
  - □  $\{A\}^+ = \{ABC\}, \quad \{B\}^+ = \{ABC\}, \quad \{C\}^+ = \{C\}$ □  $\{AB\}^+ = \{ABC\}, \quad \{AC\}^+ = \{ABC\}, \quad \{BC\}^+ = \{ABC\}$

- Non-trivial and decomposed FDs can be found using closures, in a way similar to finding keys
- Example: R(A, B, C), with A $\rightarrow$ B, B $\rightarrow$ A, B $\rightarrow$ C given
- Step 3: From each closure, remove the "trivial" attributes

  - $\Box$  {AB}<sup>+</sup> = {ABC}, {AC}<sup>+</sup> = {ABC}, {BC}<sup>+</sup> = {ABC}

- Non-trivial and decomposed FDs can be found using closures, in a way similar to finding keys
- Example: R(A, B, C), with A $\rightarrow$ B, B $\rightarrow$ A, B $\rightarrow$ C given
- Step 3: From each closure, remove the "trivial" attributes
  - □  $\{A\}^+ = \{ABC\}, \{B\}^+ = \{ABC\}, \{C\}^+ = \{C\}$ □  $\{AB\}^+ = \{ABC\}, \{AC\}^+ = \{ABC\}, \{BC\}^+ = \{ABC\}$

- Non-trivial and decomposed FDs can be found using closures, in a way similar to finding keys
- Example: R(A, B, C), with A $\rightarrow$ B, B $\rightarrow$ A, B $\rightarrow$ C given
- Step 4: Derive non-trivial and decomposed FDs from each closure

□ 
$$\{A\}^+ = \{ABC\}, \{B\}^+ = \{ABC\}, \{C\}^+ = \{C\}$$
□  $\{AB\}^+ = \{ABC\}, \{AC\}^+ = \{ABC\}, \{BC\}^+ = \{ABC\}$ 

- Non-trivial and decomposed FDs can be found using closures, in a way similar to finding keys
- Example: R(A, B, C), with A $\rightarrow$ B, B $\rightarrow$ A, B $\rightarrow$ C given
- Step 4: Derive non-trivial and decomposed FDs from each closure
  - □ A→B,
- $A \rightarrow C$

 $B \rightarrow A$ 

 $B \rightarrow C$ 

- □ AB→C,
- $AC \rightarrow B$

 $BC \rightarrow A$ 

#### **BCNF: Definition**

- A table R is in BCNF, if every non-trivial and decomposed FD has a superkey on its left hand side
- Example: R(A, B, C), with A $\rightarrow$ B, B $\rightarrow$ A, B $\rightarrow$ C given
- Non-trivial and decomposed FDs on R:
  - $\Box$  A $\rightarrow$ B,

A→C,

 $B \rightarrow A$ 

 $B \rightarrow C$ 

 $\square$  AB $\rightarrow$ C,

- $AC \rightarrow B$ ,  $BC \rightarrow A$

- Keys: A, B
- For each of the above FD, the left hand side is a superkey
- So R satisfies BCNF

#### **BCNF: Definition**

- A table R is in BCNF, if every non-trivial and decomposed FD has a superkey on its left hand side
- Example: R(A, B, C), with  $A \rightarrow B$ ,  $B \rightarrow C$  given
- Key: A
- Observe that
  - B->C is a non-trivial and decomposed FD
  - $\square$  The left hand side of B $\rightarrow$ C is not a superkey
- So R does not satisfy BCNF

#### **BCNF: Intuition**

■ BCNF requires that if there is any non-trivial and decomposed FD  $A_1A_2...A_n \rightarrow B$ , then  $A_1A_2...A_n$  must be a superkey

In other words, all attributes B can depend only

on superkeys

Any dependency on non-superkeys is prohibited by BCNF

#### **BCNF: Intuition**

- In other words, any attribute B can depend only on superkeys
- Why does this make sense?
- Suppose that B depends on a non-superkey C<sub>1</sub>C<sub>2</sub>...C<sub>n</sub>
- Since  $C_1C_2...C_n$  is not a superkey, the same  $C_1C_2...C_n$  may appear multiple times in the table
- Whenever this happens, the same B would appear multiple times in the table
- This leads to redundancy
- BCNF prevents this from happening

#### **BCNF: Intuition**

Name	<u>NRIC</u>	<u>Phone</u>	Address
Alice	1234	67899876	Jurong East
Alice	1234	83848384	Jurong East
Bob	5678	98765432	Pasir Ris

- Key: {NRIC, Phone}
- We have NRIC → Name, which violates BCNF
- Since NRIC is not a superkey, the same NRIC can appear multiple times in the table
- Every time the same NRIC is repeated, the corresponding Name and Address are also be repeated
- This leads to redundancy
- BCNF prevents this

# **Coming Next**

How do we check whether a table is in BCNF?

#### **BCNF Check**

- A table R is in BCNF, if every non-trivial and decomposed FD has a superkey on its left hand side
- Algorithm for checking BCNF
  - Compute the closure of each attribute subset
  - Derive the keys of R (using closures)
  - Derive all non-trivial and decomposed FDs on R (again, using closures)
  - Check the non-trivial and decomposed FDs to see if they satisfy the BCNF requirement
  - If all of them satisfy the requirement, then R is in BCNF

 $\blacksquare$  R(A, B, C, D) with FDs AB  $\rightarrow$  C, C  $\rightarrow$  D, and D $\rightarrow$ A

- $\blacksquare$  R(A, B, C, D) with FDs AB  $\rightarrow$  C, C  $\rightarrow$  D, and D $\rightarrow$ A
  - 1. Compute the closure for each subset of the attributes in R

  - $\Box$  {BC}<sup>+</sup>= {ABCD}, {BD}<sup>+</sup>= {ABCD}, {CD}<sup>+</sup>= {ACD}

- $\blacksquare$  R(A, B, C, D) with FDs AB  $\rightarrow$  C, C  $\rightarrow$  D, and D $\rightarrow$ A
  - 2. Derive the keys of R

$$\Box$$
 {BC}<sup>+</sup>= {ABCD}, {BD}<sup>+</sup>= {ABCD}, {CD}<sup>+</sup>= {ACD}

- $\blacksquare$  R(A, B, C, D) with FDs AB  $\rightarrow$  C, C  $\rightarrow$  D, and D $\rightarrow$ A
  - 2. Derive the keys of R: AB, BC, BD

$$\Box$$
 {BC}<sup>+</sup>= {ABCD}, {BD}<sup>+</sup>= {ABCD}, {CD}<sup>+</sup>= {ACD}

- $\blacksquare$  R(A, B, C, D) with FDs AB  $\rightarrow$  C, C  $\rightarrow$  D, and D $\rightarrow$ A
  - 2. Derive the keys of R: AB, BC, BD
  - 3. Derive the non-trivial and decomposed FDs on R

$$\Box$$
 {BC}<sup>+</sup>= {ABCD}, {BD}<sup>+</sup>= {ABCD}, {CD}<sup>+</sup>= {ACD}

- $\blacksquare$  R(A, B, C, D) with FDs AB  $\rightarrow$  C, C  $\rightarrow$  D, and D $\rightarrow$ A
  - 2. Derive the keys of R: AB, BC, BD
  - 3. Derive the non-trivial and decomposed FDs on R
  - $\Box$  C $\rightarrow$ A, C $\rightarrow$ D, D $\rightarrow$ A

  - $\Box$  {BC}<sup>+</sup>= {ABCD}, {BD}<sup>+</sup>= {ABCD}, {CD}<sup>+</sup>= {ACD}

- $\blacksquare$  R(A, B, C, D) with FDs AB  $\rightarrow$  C, C  $\rightarrow$  D, and D $\rightarrow$ A
  - 2. Derive the keys of R: AB, BC, BD
  - 3. Derive the non-trivial and decomposed FDs on R
  - $\Box$  C $\rightarrow$ A, C $\rightarrow$ D, D $\rightarrow$ A
  - $\square$  AB $\rightarrow$ C, AB $\rightarrow$ D, AC $\rightarrow$ D

- $\blacksquare$  R(A, B, C, D) with FDs AB  $\rightarrow$  C, C  $\rightarrow$  D, and D $\rightarrow$ A
  - 2. Derive the keys of R: AB, BC, BD
  - 3. Derive the non-trivial and decomposed FDs on R
  - $\Box$  C $\rightarrow$ A, C $\rightarrow$ D, D $\rightarrow$ A
  - $\square$  AB $\rightarrow$ C, AB $\rightarrow$ D, AC $\rightarrow$ D
  - $\square$  BC $\rightarrow$ A, BC $\rightarrow$ D, BD $\rightarrow$ A, BD $\rightarrow$ C, CD $\rightarrow$ A

- $\blacksquare$  R(A, B, C, D) with FDs AB  $\rightarrow$  C, C  $\rightarrow$  D, and D $\rightarrow$ A
  - 2. Derive the keys of R: AB, BC, BD
  - 3. Derive the non-trivial and decomposed FDs on R
  - $\Box$  C $\rightarrow$ A, C $\rightarrow$ D, D $\rightarrow$ A
  - $\square$  AB $\rightarrow$ C, AB $\rightarrow$ D, AC $\rightarrow$ D
  - $\square$  BC $\rightarrow$ A, BC $\rightarrow$ D, BD $\rightarrow$ A, BD $\rightarrow$ C, CD $\rightarrow$ A
  - $\square$  ABC $\rightarrow$ D, ABD $\rightarrow$ C, BCD $\rightarrow$ A

- $\blacksquare$  R(A, B, C, D) with FDs AB  $\rightarrow$  C, C  $\rightarrow$  D, and D $\rightarrow$ A
  - 2. Derive the keys of R: AB, BC, BD
  - 3. Derive the non-trivial and decomposed FDs on R
  - $\Box$  C $\rightarrow$ A, C $\rightarrow$ D, D $\rightarrow$ A
  - $\square$  AB $\rightarrow$ C, AB $\rightarrow$ D, AC $\rightarrow$ D
  - $\square$  BC $\rightarrow$ A, BC $\rightarrow$ D, BD $\rightarrow$ A, BD $\rightarrow$ C, CD $\rightarrow$ A
  - $\square$  ABC $\rightarrow$ D, ABD $\rightarrow$ C, BCD $\rightarrow$ A
  - 4. For each non-trivial and decomposed FD, check whether its left hand side is a super-key

- $\blacksquare$  R(A, B, C, D) with FDs AB  $\rightarrow$  C, C  $\rightarrow$  D, and D $\rightarrow$ A
  - 2. Derive the keys of R: AB, BC, BD
  - 3. Derive the non-trivial and decomposed FDs on R
  - $\square$  C $\rightarrow$ A, C $\rightarrow$ D, D $\rightarrow$ A
  - $\square$  AB $\rightarrow$ C, AB $\rightarrow$ D, AC $\rightarrow$ D

Not in BCNF

- $\square$  BC $\rightarrow$ A, BC $\rightarrow$ D, BD $\rightarrow$ A, BD $\rightarrow$ C, CD $\rightarrow$ A
- $\square$  ABC $\rightarrow$ D, ABD $\rightarrow$ C, BCD $\rightarrow$ A
- 4. For each non-trivial and decomposed FD, check whether its left hand side is a super-key

#### **BCNF Check**

- The previous algorithm
  - Compute the closure of each attribute subset
  - Derive the keys of R (using closures)
  - Derive all non-trivial and decomposed FDs on R (again, using closures)
  - Check the non-trivial and decomposed FDs to see if they satisfy BCNF requirement
  - If all of them satisfy the requirement, then R is in BCNF

#### Observation:

- The three steps in blue are quite tedious
- We will simplify them by combing them together, again using closures

# Simplified BCNF Check: How?

- What we need: check if there is a non-trivial and decomposed FD A₁A₂...A<sub>k</sub>→B₁, such that A₁A₂...A<sub>k</sub> is not a superkey
- Question: if  $A_1A_2...A_k$  is not a superkey, what would its closure  $\{A_1A_2...A_k\}^+$  look like?
- First, the closure should contain  $B_1$ , since  $A_1A_2...A_k \rightarrow B_1$ 
  - i.e., the closure contains **more** attributes than  $\{A_1A_2...A_k\}$  does
- Second, the closure should not contain all attributes in the table, since A<sub>1</sub>A<sub>2</sub>...A<sub>k</sub> is not a superkey
  - i.e., the closure contains **not all** attributes in the table
- Conclusion: we have a violation of BCNF, iff we have a closure that satisfies the "more but not all" condition

# Simplified BCNF Check: Algorithm

- Conclusion: we have a violation of BCNF, iff we have a closure that satisfies the "more but not all" condition
- Simplified Algorithm for BCNF check:
  - Compute the closure of each attribute subset
  - □ Check if there is a closure  $\{A_1A_2...A_k\}^+$ , such that
    - The closure contains some attribute not in  $\{A_1A_2...A_k\}$
    - The closure does not contain all attributes in the table
    - i.e., a "more but not all" closure
  - If such a closure exists, then R is NOT in BCNF

# Simplified BCNF Check: Example

 $\blacksquare$  R(A, B, C, D) with FDs AB  $\rightarrow$  C, C  $\rightarrow$  D, and D  $\rightarrow$  A

# Simplified BCNF Check: Example

- $\blacksquare$  R(A, B, C, D) with FDs AB  $\rightarrow$  C, C  $\rightarrow$  D, and D $\rightarrow$ A
  - 1. Compute the closure of each attribute subset
- Stop right there...
- Take a look at {C}<sup>+</sup>= {ACD}
  - {C}<sup>+</sup> contains more attributes than {C} does
  - {C}<sup>+</sup> does not contain all attributes in R
- "More but not all", which is a violation of BCNF
- So R is not in BCNF

- R(A, B, C, D) with FDs B  $\rightarrow$  C, B  $\rightarrow$  D
- Is R in BCNF?

#### Not in BCNF

- $\blacksquare$  R(A, B, C, D) with FDs B  $\rightarrow$  C, B  $\rightarrow$  D
  - Compute the closure of each attribute subset
  - {B}<sup>+</sup>= {BCD} stratifies the "more but not all" property
  - So it indicates a violation of BCNF

- R(A, B, C, D) with FDs A  $\rightarrow$  B, B  $\rightarrow$  C, C $\rightarrow$ D, and D $\rightarrow$ A
- Is R in BCNF?

#### In BCNF

- R(A, B, C, D) with FDs A  $\rightarrow$  B, B  $\rightarrow$  C, C $\rightarrow$ D, and D $\rightarrow$ A
  - Compute the closure for each subset of the attributes in R

    - The other closures are all {ABCD}
  - There would be no closure satisfying the "more but not all" property
  - So there is no violation of BCNF

- R(A, B, C, D, E) with FDs AB  $\rightarrow$  C, C  $\rightarrow$  E, E  $\rightarrow$  A, and E  $\rightarrow$  D
- Is R in BCNF?

#### Not In BCNF

- R(A, B, C, D, E) with FDs AB  $\rightarrow$  C, C  $\rightarrow$  E, E  $\rightarrow$  A, and E  $\rightarrow$  D
  - Compute the closure for each subset of the attributes in R
  - {E}\*= {ADE} satisfies the "more but not all" property
  - So {E}+= {ADE} indicates a violation of BCNF

- R(A, B, C, D) with FDs AB  $\rightarrow$  D, BD  $\rightarrow$  C, CD  $\rightarrow$  A, and AC  $\rightarrow$  B
- Is R in BCNF?

#### In BCNF

- R(A, B, C, D) with FDs AB  $\rightarrow$  D, BD  $\rightarrow$  C, CD  $\rightarrow$  A, and AC  $\rightarrow$  B
  - Compute the closure for each subset of the attributes in R

$$= {AD}^+ = {AD}, {BC}^+ = {BC}$$

- There is no closure satisfying the "more but not all" property
- So there is no violation of BCNF

## Roadmap

- Now we know how to check whether a table is in BCNF
- But if a table is not in BCNF, how can we improve it?
- We can decompose it into smaller tables
  - This is also called a normalization

## **BCNF** Decomposition

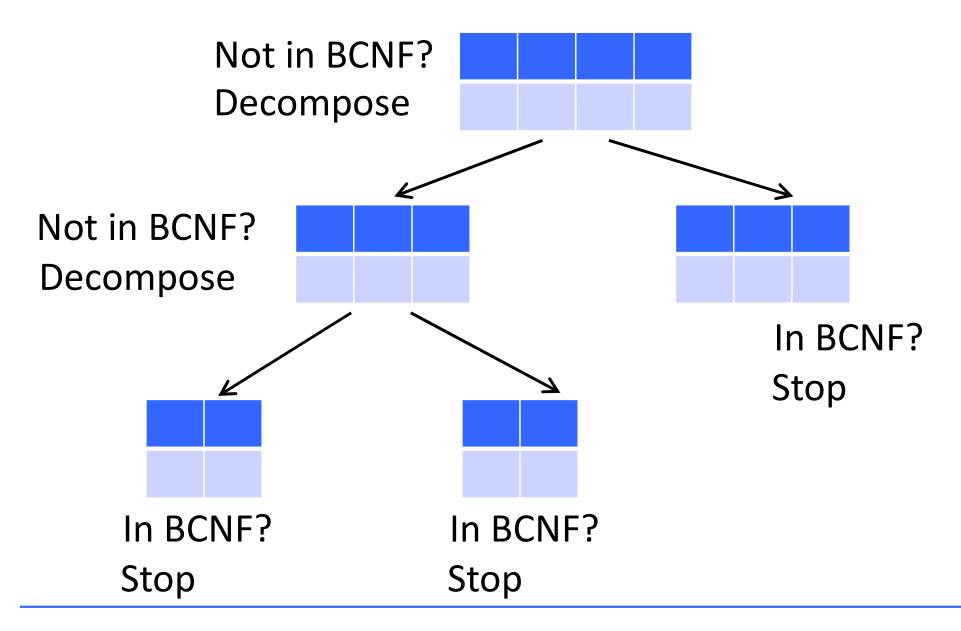

Name	<u>NRIC</u>	<u>PhoneNumber</u>	HomeAddress

### Decompose, until all are in BCNF

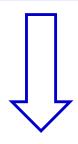

- Input: a table R
- Find a subset X of the attributes in R, such that its closure {X}<sup>+</sup> (i) contains more attributes than X does, but (ii) does not contain all attributes in R
- 2. Decompose R into two tables  $R_1$  and  $R_2$ , such that
  - $\square$  R<sub>1</sub> contains all attributes in  $\{X\}^+$
  - R<sub>2</sub> contains all attributes in X as well as the attributes not in {X}<sup>+</sup>
- If R<sub>1</sub> is not in BCNF, further decompose R<sub>1</sub>; If R<sub>2</sub> is not in BCNF, further decompose R<sub>2</sub>

Name	<u>NRIC</u>	<u>PhoneNumber</u>	HomeAddress
Alice	1234	67899876	Jurong East
Alice	1234	83848384	Jurong East
Bob	5678	98765432	Pasir Ris

- FD: NRIC → Name, HomeAddress
  - 1. Find a subset X of the attributes in R, such that its closure  $X^{+}$  (i) contains more attributes than X, but (ii) does not contain all attributes in R
- {NRIC}<sup>+</sup> = {Name, NRIC, HomeAddress}
  - 2. Decompose R into two tables R<sub>1</sub> and R<sub>2</sub>, such that
  - R<sub>1</sub> contains all attributes in X<sup>+</sup>
  - R<sub>2</sub> contains all attributes in X as well as the attributes not in X<sup>+</sup>
- R<sub>1</sub>(Name, NRIC, HomeAddress), R<sub>2</sub>(NRIC, PhoneNumber)
  - 3. Check if R<sub>1</sub> and R<sub>2</sub> are in BCNF, and so on. (Spoiler: they are in BCNF)

Name	<u>NRIC</u>	<u>PhoneNumber</u>	HomeAddress
Alice	1234	67899876	Jurong East
Alice	1234	83848384	Jurong East
Bob	5678	98765432	Pasir Ris

<u>NRIC</u>	<u>PhoneNumber</u>
1234	67899876
1234	83848384
5678	98765432

- R(A, B, C, D) with FDs A $\rightarrow$ B, B $\rightarrow$ C
- 1. Find a subset X of the attributes in R, such that its closure {X}<sup>+</sup> (i) contains more attributes than X, but (ii) does not contain all attributes in R
- $\{A\}^+ = \{A, B, C\}$
- 2. Decompose R into two tables  $R_1$  and  $R_2$ , such that
  - R<sub>1</sub> contains all attributes in {X}<sup>+</sup>
  - $\square$  R<sub>2</sub> contains all attributes in X as well as the attributes not in  $\{X\}^+$
- $R_1(A, B, C), R_2(A, D)$
- 3. Check if R<sub>1</sub> and R<sub>2</sub> are in BCNF
- $\blacksquare$  R<sub>1</sub>: No, R<sub>2</sub>: Yes
- 4. Further decompose R<sub>1</sub>

- R(A, B, C, D) with FDs A $\rightarrow$ B, B $\rightarrow$ C
- $R_1(A, B, C), R_2(A, D)$
- Further decompose R<sub>1</sub>
- 1. Find a subset X of the attributes in R<sub>1</sub>, such that its closure {X}<sup>+</sup> (i) contains more attributes than X, but (ii) does not contain all attributes in R
- 2. Decompose  $R_1$  into two tables  $R_3$  and  $R_4$ , such that
  - $\square$  R<sub>3</sub> contains all attributes in  $\{X\}^+$
  - R<sub>4</sub> contains all attributes in X as well as the attributes not in {X}<sup>+</sup>
- $R_3(B, C), R_4(A, B)$
- 3. Check if R<sub>1</sub> and R<sub>2</sub> are in BCNF
- $\mathbf{R}_3$ : Yes,  $\mathbf{R}_4$ : Yes
- Final results:  $R_3(B, C)$ ,  $R_4(A, B)$ ,  $R_2(A, D)$

## Decompose, until all are in BCNF

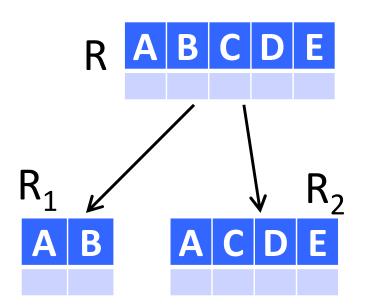

#### **Notes**

The BCNF decomposition of a table may not be unique

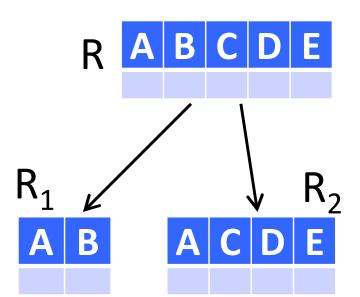

- If a table has only two attributes, then it must be in BCNF
  - Therefore, you do not need to check tables with only two attributes

- Recall that, whenever we decompose a table R into two smaller tables R<sub>1</sub> and R<sub>2</sub>, we need to check whether R<sub>1</sub> and R<sub>2</sub> satisfies BCNF
- This requires us to check the closures on R<sub>1</sub> and R<sub>2</sub>
- We will explain how this can be done using an example

- Given:  $A \rightarrow B$ ,  $BC \rightarrow D$
- Step 1: Check if there is closure that indicates a violation of BCNF
- Step 2: Decompose the table into two
  - First one: include all attributes in the closure, i.e, {A, B}
  - Second one: include A and all attributes NOT in the closure, i.e., {A, C, D, E}
- Now we need to check whether R<sub>1</sub> and R<sub>2</sub> are in BCNF
- R<sub>1</sub> is in BCNF; but what about R<sub>2</sub>?

- Given:  $A \rightarrow B$ ,  $BC \rightarrow D$
- To check whether R<sub>2</sub> is in BCNF, we need to derive the closures for R<sub>2</sub>
- But we don't know what FDs are there on R<sub>2</sub>
- Solution:
  - Derive the closures on R
  - Then, project them onto R<sub>2</sub>

- Given:  $A \rightarrow B$ ,  $BC \rightarrow D$
- Deriving closures for R<sub>2</sub>
  - Step 1: enumerate the attribute subsets in R<sub>2</sub>

{AC}+={ACD}

 ${AD}^{+}={AD}$ 

 $\{CD\}^+=\{CD\}$ 

{CE}+={CE}

 $\{DE\}^+=\{DE\}$ 

{ACD}+={ACD}

{ACE}+={ACDE}

{ADE}+={ACDE}

{CDE} +={CDE}

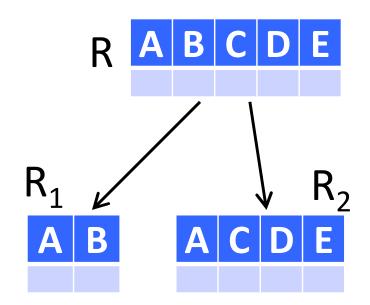

- Given:  $A \rightarrow B$ ,  $BC \rightarrow D$
- Deriving closures for R<sub>2</sub>
  - Step 3: Project these closures onto R<sub>2</sub>, by removing irrelevant attributes
    - $\{A\}^+ = \{A\}$
    - {D}+={D}
    - {AC}+={ACD}
    - {AE}+={AE}
    - {CE}+={CE}
    - {ACD}+={ACD}
    - {ADE}+={ACDE}

- $\{C\}^+=\{C\}$
- $\{\mathsf{E}\}^+ = \{\mathsf{E}\}$
- ${AD}^{+}={AD}$

$$\{CD\}^+=\{CD\}$$

$$\{DE\}^+=\{DE\}$$

- This closure violates BCNF
- So R2 is not in BCNF

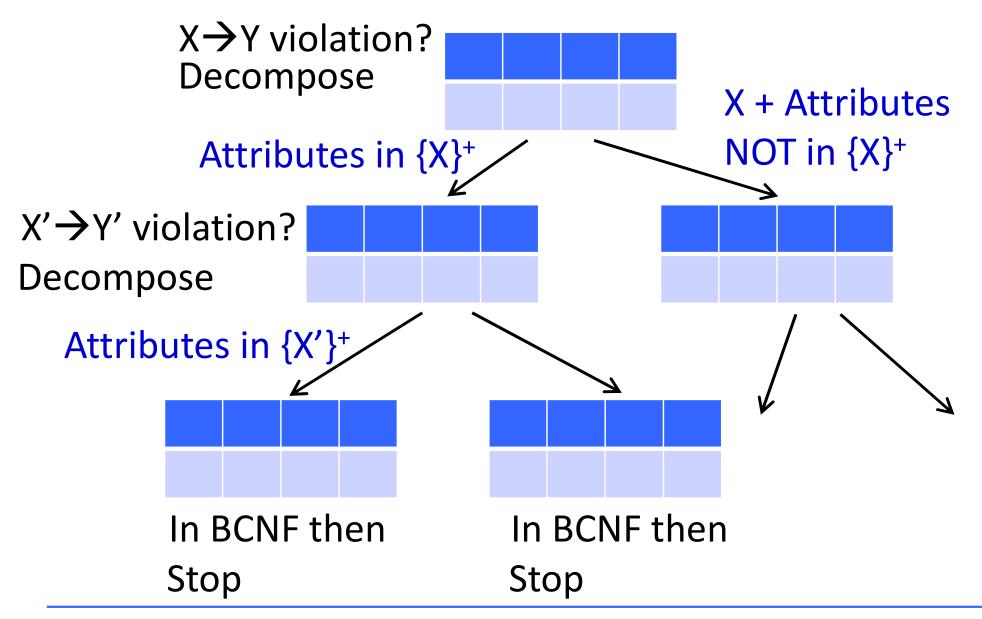

# **Projection of Closures/FDs**

- In general, if we are to derive the closures on a table R<sub>i</sub> that is decomposed from a table R, we can
  - First, enumerate the attribute subsets of R<sub>i</sub>
  - For each subset, derive its closure on R
  - Project each closure onto R<sub>i</sub> by removing those attributes that do not appear in R<sub>i</sub>
- These projected closures can then be used to
  - Decide whether R<sub>i</sub> is in BCNF
  - Further decompose R<sub>i</sub> (if R<sub>i</sub> violates BCNF)

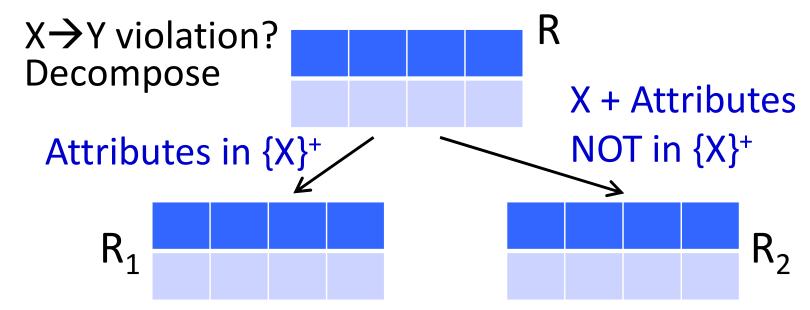

# Question

- Why does the BCNF decomposition algorithm work?
- Why can it eliminate violations of BCNF?

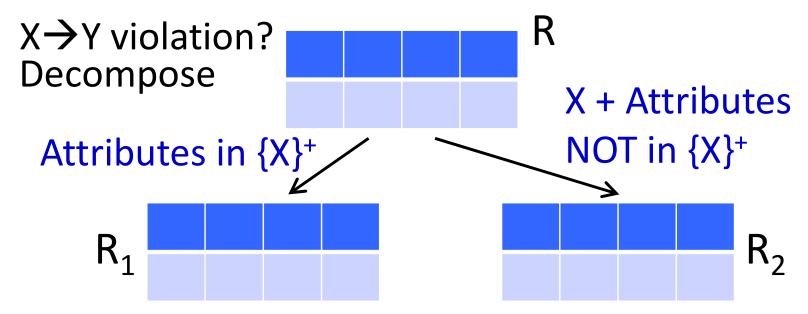

# **BCNF Decomposition Algorithm**

# **BCNF Decomposition Algorithm**

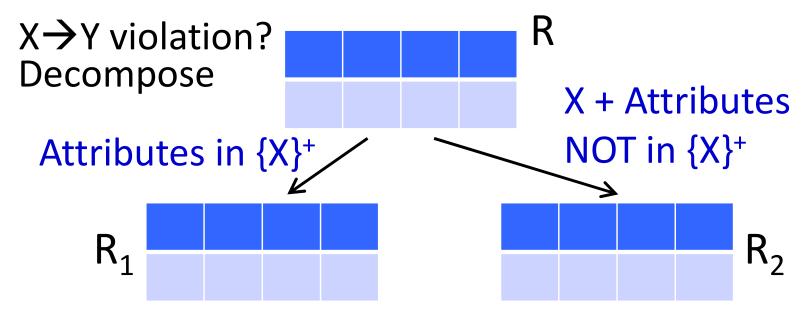

# **BCNF Decomposition Algorithm**

- $\blacksquare$  X $\rightarrow$ Y is no longer a BCNF violation on R<sub>1</sub>
- $\blacksquare$  X $\rightarrow$ Y is no longer an FD on R<sub>2</sub>
- So this decomposition step gets rid of one BCNF violation

# **BCNF Decomposition Algorithm**

- In general, each decomposition step removes at least one BCNF violation
- Recursive decomposition ==> all violations will be removed in the end

- R(A, B, C, D) with FDs A $\rightarrow$ B, A $\rightarrow$ C
- Find a subset X of the attributes in R, such that its closure X<sup>+</sup> (i) contains more attributes than X, but (ii) does not contain all attributes in R
- 2. Decompose R into two tables  $R_1$  and  $R_2$ , such that
  - R<sub>1</sub> contains all attributes in X<sup>+</sup>
  - R<sub>2</sub> contains all attributes in X as well as the attributes not in X<sup>+</sup>
- If  $R_1$  is not in BCNF, further decompose  $R_1$ ; If  $R_2$  is not in BCNF, further decompose  $R_2$

- $\blacksquare$  R(A, B, C, D) with FDs A $\rightarrow$ B, A $\rightarrow$ C
- 1. Find a subset X of the attributes in R, such that its closure X<sup>+</sup> (i) contains more attributes than X, but (ii) does not contain all attributes in R
- $\{A\}^+ = \{A, B, C\}$
- 2. Decompose R into two tables R<sub>1</sub> and R<sub>2</sub>, such that
  - R₁ contains all attributes in X<sup>+</sup>
  - R<sub>2</sub> contains all attributes in X as well as the attributes not in X<sup>+</sup>
- $R_1(A, B, C), R_2(A, D)$
- 3. Check if R<sub>1</sub> and R<sub>2</sub> are in BCNF
- Yes. Final results:  $R_1(A, B, C)$ ,  $R_2(A, D)$

- R(A, B, C, D) with FDs BC $\rightarrow$ D, D $\rightarrow$ A, A $\rightarrow$ B
- Find a subset X of the attributes in R, such that its closure X<sup>+</sup> (i) contains more attributes than X, but (ii) does not contain all attributes in R
- 2. Decompose R into two tables  $R_1$  and  $R_2$ , such that
  - R<sub>1</sub> contains all attributes in X<sup>+</sup>
  - R<sub>2</sub> contains all attributes in X as well as the attributes not in X<sup>+</sup>
- If  $R_1$  is not in BCNF, further decompose  $R_1$ ; If  $R_2$  is not in BCNF, further decompose  $R_2$

- R(A, B, C, D) with FDs BC $\rightarrow$ D, D $\rightarrow$ A, A $\rightarrow$ B
- 1. Find a subset X of the attributes in R, such that its closure X<sup>+</sup> (i) contains more attributes than X, but (ii) does not contain all attributes in R
- $\{A\}^+ = \{A, B\}$
- 2. Decompose R into two tables  $R_1$  and  $R_2$ , such that
  - R<sub>1</sub> contains all attributes in X<sup>+</sup>
  - R<sub>2</sub> contains all attributes in X as well as the attributes not in X<sup>+</sup>
- $R_1(A, B), R_2(A, C, D)$
- 3. Check if R<sub>1</sub> and R<sub>2</sub> are in BCNF
- R<sub>1</sub>: Yes. R<sub>2</sub>: No
- Further decompose R2

- R(A, B, C, D) with FDs BC $\rightarrow$ D, D $\rightarrow$ A, A $\rightarrow$ B
- $R_1(A, B), R_2(A, C, D)$
- Further decompose R<sub>2</sub>
- 1. Find a subset X of the attributes in  $R_2$ , such that its closure  $X^+$  (i) contains more attributes than X, but (ii) does not contain all attributes in  $R_2$
- 2. Decompose R<sub>1</sub> into two tables R<sub>3</sub> and R<sub>4</sub>, such that
  - R<sub>3</sub> contains all attributes in X<sup>+</sup>
  - $\square$  R<sub>4</sub> contains all attributes in X as well as the attributes not in X<sup>+</sup>
- $R_3(A, D), R_4(C, D)$
- 3. Check if  $R_3$  and  $R_4$  are in BCNF
- Yes. Final results:  $R_1(A, B)$ ,  $R_3(A, D)$ ,  $R_4(C, D)$

## **Properties of BCNF**

- Good properties
  - No update or deletion or insertion anomalies
  - Small redundancy
  - The original table can always be reconstructed from the decomposed tables

## **Table Reconstruction**

Name	<u>NRIC</u>	<u>PhoneNumber</u>	HomeAddress

# **Lossless Join Decomposition**

- Say we decompose a table R into two tables R<sub>1</sub> and R<sub>2</sub>
- The decomposition guarantees lossless join, whenever the common attributes in R<sub>1</sub> and R<sub>2</sub> constitute a superkey of R<sub>1</sub> or R<sub>2</sub>
- Example
  - R(A, B, C) decomposed into R<sub>1</sub>(A, B) and R<sub>2</sub> (B, C), with B being a superkey of R<sub>2</sub>
  - R(A, B, C, D) decomposed into R<sub>1</sub>(A, B, C) and R<sub>2</sub> (B, C, D), with BC being a superkey of R<sub>1</sub>

# Why BCNF guarantees lossless join?

- Decompose R into two tables R<sub>1</sub> and R<sub>2</sub>, such that
  - R<sub>1</sub> contains all attributes in {X}<sup>+</sup>
  - $Arr R_2$  contains all attributes in X as well as the attributes not in  $\{X\}^+$
- X is the set of common attributes between R<sub>1</sub> and
   R<sub>2</sub>
- X is a superkey of R<sub>1</sub>

## **Properties of BCNF**

#### Good properties

- No update or deletion or insertion anomalies
- Small redundancy
- The original table can always be reconstructed from the decomposed tables

#### Bad properties

- Dependencies may not be preserved
- We will talk about it in the next lecture
